

YOU CAN STOP ARMILLARIA!

Vinevax Bio-injection orchard results show ongoing protection in greater than 90% of treated vines, directly threatened by disease.

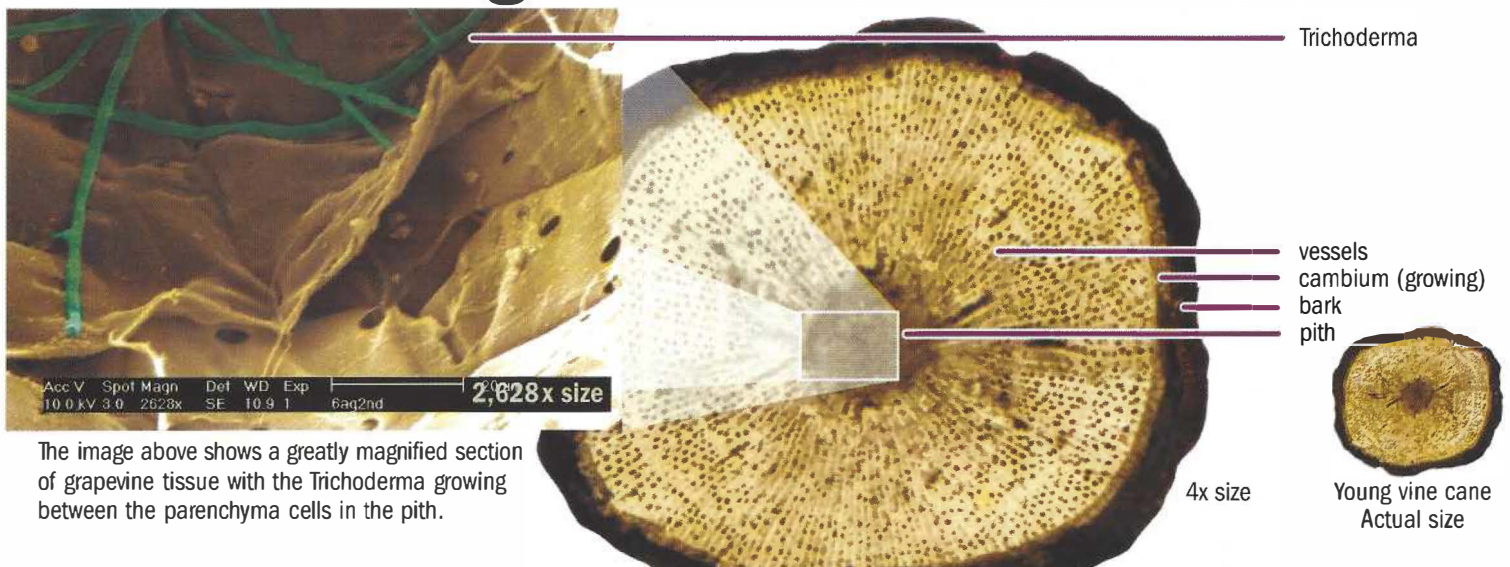

- Immediate circulation
- 1.5m+ vascular movement
- Rapid disease inhibition
- Easy to use application
- Long term plant protection
- Proven track record
- Documented efficacy
- Cost effective

Kiwifruit vine Rootball

Green highlights show Bio-injection penetration into the root's vascular system.

Exciting new research results give clear understanding of how Vinevax works.

The image above shows a greatly magnified section of grapevine tissue with the Trichoderma growing between the parenchyma cells in the pith.

YOU CAN STOP ARMILLARIA!

Vinevax is the only proven, cost effective treatment for the control of Armillaria.

Comprehensive independent test results* (on nearly 13,000 kiwifruit vines) show that successful control of Armillaria is achieved by establishing a Vinevax protected perimeter zone, surrounding diseased vines. *NZ Kiwifruit Journal, 130 1998 p30-32

INCREDIBLE RESULTS!

Test results data show enormous benefits to Kiwifruit vines 3 years after treatment with Vinevax bio-injection (in a total of 12,993 vines treated). Armillaria spreads invasively underground threatening all healthy vines in areas surrounding disease outbreaks.

The key to successful control of Armillaria, is the protection of all healthy vines under threat.

Survival of kiwifruit vines 3 years after treatment with Vinevax bio-injection

Majority of deaths occurred in the first season after treatment indicating pre-infection.
